

# ProMed Secure ID

Innovative authentication solutions for healthcare data and identity management

## The Key to Promoting Patient Security and Privacy

An increasing number of patients are encountering an alarming trend where their confidentiality is being compromised. In order to circumvent this, the U.S. Congress has strongly recommended that medical organizations adopt an electronic medical record system. As an additional safeguard to patient privacy, the federal government is now regulating the protection of healthcare data. With the passage of the Health Insurance Portability and Accountability Act (HIPAA), medical personnel are now required to use two forms of authentication in order to access patient medical records and other sensitive data.

**ProMed Secure ID** is the key to promoting patient security and privacy. Fujitsu's innovative biometric device, the **PalmSecure™ Palm Vein Authentication System**, was selected to provide the core technology behind **ProMed Secure ID**.

**For Registration**

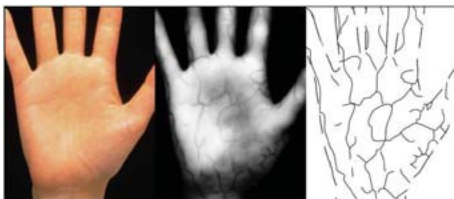

**For Clinical Use**

**For Employee Identification**

The **PalmSecure™** captures the hand's vein pattern using near-infrared light. Since palm vein patterns are unique to each person, it is very difficult to forge an individual's identity. Also, because the technology is highly accurate, healthcare systems are provided with an extra layer of necessary protection. With sensor's high level of reliability, the **PalmSecure™** does not require direct physical contact, and can be used with or without surgical gloves.

*Near-infrared palm vein image*

**ProMed Secure ID** is powered by Fujitsu's innovative biometric device, the **PalmSecure™ Palm Vein Authentication System**.

The award-winning Fujitsu **PalmSecure™** device utilizes the latest in biometric security technology. Because its contactless authentication is hygienic and non-invasive, healthcare facilities can expect a high level of user acceptance from patients and medical staff alike. In addition, the sensor's high level of versatility makes it applicable to virtually all users. And most importantly, the high level of accuracy will help the healthcare facility comply with federally mandated regulations regarding the safety and protection of patients, staff, and the organization as a whole.

## Secure ID For Registration

In patient registration, **ProMed Secure ID** enables positive identification of the patient. It takes less than a minute to register the patient and attach the Medical Record number in the HIS. No more misidentified patients. It can also be used to shorten the registration process for frequent, returning patients by using a patient registration kiosk. Returning patients can be registered by the **PalmSecure™**, enabling their record to be automatically pulled from your HIS and displayed for the next available registration staff member. **ProMed Secure ID** is coupled with the **ProMed Patient Registration** scanning module, directly linking scanned insurance cards and driver licenses to positive patient ID.

## Secure ID For Clinical Use

**ProMed Secure ID** enables positive identification of the patient for all areas of patient care, including the Lab for lab draws, Pharmacy and Nursing for medication administration, Blood Bank, Radiology, and within operating and procedure rooms. Instead of relying on wrist bands and barcodes, the use of the **PalmSecure™** will improve compliance and guarantee the correct patient receives the services you are providing.

## Secure ID For Employee Identification

**ProMed Secure ID** ensures positive identification of the staff member in all areas of patient care to allow/prevent access to different computerized systems or areas of the facility. Wherever positive identification of the employee is required, the **PalmSecure™** can be utilized.

## Key Benefits of ProMed Secure ID:

- Protects patient records while assisting with HIPAA regulatory compliance
- Improves patient services through enhancement of secured information sharing capabilities
- Reduces organizational expenses and administrative tasks
- Assists with combating healthcare insurance and billing fraud
- Non-invasive, contactless and highly accurate biometric technology
